SUMMARY

Software Engineer focused on software architecture and systems, with 3+ years designing full-stack solutions for business process automation, B2B integrations, and transactional flows (payments, CRM, messaging). Experienced in modeling relational and multi-tenant data schemas (PostgreSQL, SQL Server), defining technology stacks and architecture patterns, and leading end-to-end solutions in React, Next.js, Node.js, and C#/.NET. Advanced student of the B.Sc. in Information Systems (UNSJ) — OOP, algorithms and data structures, Python, C++. Co-founder of Pulso Studio, driving product ownership across SaaS solutions and internal tools end-to-end. English level: C1 (fluent for international roles).

PROFESSIONAL EXPERIENCE

Full Stack | ANT Automation | Jul 2023 - Mar 2026

Backend and dashboard development for internal industrial automation platforms.

- Designed and implemented backend services in C# / .NET with Entity Framework over SQL Server, optimizing critical queries to cut response times on high-volume reports.
- Modeled and maintained relational schemas across multiple internal modules, ensuring data integrity and scalability.
- Built dashboards and visualizations (React, Redux, Material UI, Highcharts) to expose real-time operational metrics.
- Implemented custom plugins and features for internal platforms, integrating external APIs.
- Used Docker to standardize development environments and service deployment.

Co-Founder & Software Engineer | Pulso Studio | Feb 2026 - Present

Technical consulting studio and B2B operational-solution development for professionals and businesses.

- Defined product architecture and technology stack for each solution, weighing cost, scalability, and maintainability trade-offs with clients.
- Designed and built websites, landing pages, and internal tools focused on lead generation and operational efficiency.
- Integrated forms, email automation, and analytics, turning user behavior into product decisions.

Software Engineer | Compass (evolved from Pulso CRM)

All-in-one SaaS platform consolidating CRM, agile project management, and financial tracking. Stack: React 19, Vite, CSS Modules, Zustand, TanStack Query v5, PostgreSQL (Supabase), @dnd-kit, Vercel.

- Designed the end-to-end full-stack architecture, modeling a multi-tenant relational schema in PostgreSQL with Row Level Security (RLS) to isolate client data without duplicating infrastructure.
- Consolidated 4 operational processes (clients, projects, finances, credentials) into a single platform, eliminating scattered tooling.
- Decoupled the frontend with custom hooks on TanStack Query v5 and optimistic mutations, achieving imperceptible latency on the kanban board (@dnd-kit).
- Built a design system from scratch (CSS Modules, no external UI libraries), maintaining visual consistency across 6+ functional modules.

Software Engineer | Crew (evolved from Crux Escalada) | Mar 2026 - Present

SaaS product for access control, attendance, and scheduling for gyms via dynamic QR codes.

Evolved the internal tool built for a climbing gym (Crux Escalada) into a product generalized for any type of gym, adding authentication, per-brand plans, and a recurring subscription gateway.

- Generalized the data model and shift/slot logic — originally built for a single client — into a reusable multi-tenant schema.
- Implemented authentication and a recurring subscription gateway with Mercado Pago, enabling automated per-plan, per-brand billing.
- Designed the dynamic QR code system for access control and attendance, speeding up check-ins and cutting manual staff work.
- Built the admin panel for users, schedules, and attendance reporting.

Software Engineer | B2B Conversational Agent (Telegram + Salesforce) — Personal Project | May 2026

B2B conversational agent integrated with Salesforce CRM to automate catalog queries and order generation.

- Designed and implemented a complete n8n workflow with AI Agent (Claude API), conversational memory, and multiple orchestrated tools.
- Orchestrated a bidirectional integration with Salesforce REST API (SOQL) for catalog queries (PricebookEntry), client registration (Account), and real-time order creation (Opportunity).
- Implemented a custom Apex REST endpoint for transactional operations in Salesforce.
- Exposed the local server to the internet via Cloudflare Tunnel to receive Telegram webhooks.

Software Engineer | Monteca

Operations management dashboard with automated messaging and notifications.

- Designed n8n pipelines to automate messaging delivery and notification flows based on business rules.
- Built the operations management dashboard, integrating automated flows into daily business operations.
- Orchestrated communication across pipeline services, cutting manual follow-up and customer-notification work.

Software Engineer | Brief.

Automated news platform with an ETL pipeline and its own newsletter service.

- Designed an ETL pipeline in n8n that ingests, processes, and normalizes news from multiple sources.
- Modeled data persistence in PostgreSQL (Supabase) and built the web rendering layer for processed content.
- Orchestrated an automated newsletter service (Top 5) that selects and emails the most relevant news with no manual intervention.

Software Engineer | Algorithmic Benchmark Tool Open Source (In Progress)

CLI tool for empirical algorithm analysis.

- Designing and building a CLI tool to measure and compare the time and space complexity of algorithms empirically.
- Developing a benchmarking engine that instruments memory and CPU usage to generate reproducible efficiency metrics.
- Applying algorithm analysis and data structures fundamentals to validate theoretical behavior (Big O) against measured results.

Software Engineer | Mountain Project Scraper — Personal Project

Resilient scraper extracting climbing routes across Argentina from mountainproject.com, exporting results to JSON.

- Automated browser navigation with Playwright to handle JavaScript-rendered content.
- Implemented exponential backoff retries and selective resource blocking to reduce load times.
- Designed field-level selectors with fallbacks, tolerating layout variations without interrupting execution.

Full Stack Developer | Coneq | Dec 2024 - Jan 2025

Corporate website for an engineering and construction company.

- Built the full corporate site with responsive design (mobile, tablet, desktop) and a multilanguage system (i18n).
- Optimized SEO and web performance, integrating forms (EmailJS) and interactive maps (LeafletJS).

Full Stack Developer | GROOVY E-commerce — Personal Project, in progress

E-commerce site for an outdoor apparel brand. Stack: Next.js + Tailwind CSS.

- Designed the design token system (color, typography, spacing) and frontend architecture, built for maintainability without external UI frameworks.
- Built the full e-commerce flow: catalog, product page, cart, and checkout.

Full Stack Developer | B2B Landing Page Monteca

Stack: React 19 + Vite + CSS Modules.

- Designed and implemented a corporate dark-mode interface with glassmorphism and a custom design system (color and spacing tokens), no UI frameworks.
- Integrated a hero-embedded quote form with inline validation, no external libraries.

Full Stack Developer | Insurance Policy Management System Monteca

Stack: React 19 + Vite + Supabase (PostgreSQL + Auth).

- Modeled CRUD for clients, vehicles, and insurance contracts, with a 3-step guided flow for policy issuance.
- Designed vehicle-status logic automatically derived from active/expired contracts, with an admin panel, auth, and protected routes.

Front End Developer | QXM (Quien x mi) | Sep 2023 - Dec 2023

- Built landing pages and interactive dashboards with reusable components in React and Angular, styled with SCSS and Bootstrap.
- Collaborated with the backend team (NestJS and SQL) on data integration.

TECH STACK

Architecture & Design: Software Architecture, UML Modeling, System Design, Data Modeling (PostgreSQL, SQL Server), Multi-tenant Systems, RESTful APIs, Event-Driven / ETL Pipelines

Backend & Cloud/Integrations: C#, .NET, Node.js, Express, NestJS, Supabase, n8n (AI Agents & Workflows), Salesforce API (Apex/SOQL), Mercado Pago API, Docker, Cloudflare

Frontend: React 19, Next.js, Vite, TypeScript/JavaScript, TanStack Query, Zustand, CSS Modules, Design Tokens

Fundamentals & Other: Python, C++, OOP, Algorithms & Data Structures, Git, Jira

EDUCATION

B.Sc. Information Systems | Universidad Nacional de San Juan | 2024 - Present

Full Stack Web Developer Bootcamp | Henry Bootcamp | 800 hours | 2023

LANGUAGES

English: C1 (Advanced) | **Spanish:** Native | **Italian:** A2
